

IN THE ABSTRACT:

Please replace the abstract with the following:

A system and method that improve a process of creating software programs for a variety of existing computing platforms. The method includes the steps of: receiving a formatted data file having a predefined, platform independent structure, compiling a common generation file, written in a lowest common denominator language utilized by each of the plurality of computing platforms, with the data file to generate a predefined output file. The output file will be compatible with one of a plurality of computing platforms. The system generates a predefined output file utilizing a common generation file adapted to create the predefined output file that is compatible with each of a plurality of computing platforms, and a compiler for compiling the common generation file with a data file having a predefined and platform independent structure.
